Child SCOAT6[™]

Sport Concussion Office Assessment Tool For Children Ages 8 to 12 Years

What is the Child SCOAT6?*

The Child SCOAT6 is a tool for evaluating concussions in a controlled office environment by Health Care Professionals (HCP) typically from 72 hours (3 days) following a sport-related concussion.

The diagnosis of concussion is a clinical determination made by an HCP. The various components of the Child SCOAT6 may assist with the clinical assessment and help guide individualised management.

The Child SCOAT6 is used for evaluating athletes aged 8 - 12 years. For athletes aged 13 years and older, please use the SCOAT6.

Brief verbal instructions for some components of the Child SCOAT6 are included. Detailed instructions for use of the Child SCOAT6 are provided in an accompanying document. Please read through these instructions carefully before using the Child SCOAT6.

This tool may be freely copied in its current form for distribution to individuals, teams, groups, and organisations.

Any alteration (including translations and digital reformatting), re-branding, or sale for commercial gain is not permissible without the expressed written consent of BMJ and the Concussion in Sport Group (CISG).

Verbal Cognitive Tests

Immediate Memory

All 3 trials must be administered irrespective of the number correct on Trial 1. Administer at the rate of one word per second in a monotone voice.

Trial 1: Say "I am going to test your memory. I will read you a list of words and when I am done, repeat back as many words as you can remember, in any order."

Trials 2 and 3: Say "I am going to repeat the same list. Repeat back as many words as you can remember in any order
even if you said the word before in a previous trial."

Word list used: A B C							Alternate	e Lists
List A	Tria	al 1	Tria	al 2	Tria	il 3	List B	List C
Jacket	0	1	0	1	0	1	Finger	Baby
Arrow	0	1	0	1	0	1	Penny	Monkey
Pepper	0	1	0	1	0	1	Blanket	Perfume

Saddle	0	1	0	1	0	1	Sandwich	Saddle
Anchor	0	1	0	1	0	1	Wagon	Bubble
Trial Total								
Immediate Memory Total o	of 30							

Time last trial completed:

Digits Backwards

Administer at the rate of one word per second in a monotone voice.

Say "I am going to read a string of numbers and when I am done, you repeat them back to me in reverse order of how I read them to you. For example, if I say 7-1, you would say 1-7. So, if I said 6-8 you would say? (8-6)"

Digit list used: A	ВСС					
List A	List B	List C				
2-7	9-2	7-8	Y	N	0	1
5-9	6-1	5-1	Y	Ν	0	1
7-8-2	3-8-2	2-7-1	Y	Ν	0	1
9-2-6	5-1-8	4-7-9	Y	Ν	U	1
4-1-8-3	2-7-9-3	1-6-8-3	Y	Ν	0	1
9-7-2-3	2-1-6-9	3-9-2-4	Y	Ν	0	1
1-7-9-2-6	4-1-8-6-9	2-4-7-5-8	Y	Ν	0	1
4-1-7-5-2	9-4-1-7-5	8-3-9-6-4	Y	Ν	0	1
6-0-1-3-5-7	2-5-1-3-9-8	0-7-5-8-1-6	Y	Ν	0	1
6-1-2-8-0-7	0-8-5-1-9-4	0-2-8-4-7-1	Y	Ν	0	1
				Digits score	e	of 4

Days in Reverse Order Say "Now tell me the days of the week in reverse order. Start with the last day and go backward. So you'll say Sunday, Saturday, and so on... Go ahead." Start stopwatch and CIRCLE each correct response: Sunday Saturday Friday Thursday Wednesday Tuesday Monday Time Taken to Complete (secs): (N <30 sec)</td> Number of Errors:

British Journal of Sports Medicine

Symbol Digit Modalities Test

A measure of psychomotor processing speed.

If clinically indicated based on symptoms and clinical findings

SDMT contained in Child SCOAT6 Supplementary Material

Examination

Orthostatic Vital Signs

Take the child's blood pressure and pulse via digital sphygmomanometer after lying supine for 2 minutes; and then again after standing unsupported for 2 minutes. An option is to perform an additional assessment between lying and standing: after sitting upright for 2 minutes. The child is asked if they experience any symptoms such as: dizziness or light-headedness, fainting, blurred or fading vision, nausea, fatigue, or lack of concentration.

Orthostatic Vital Signs	Supine (after 2 minutes)	Standing (after 2 minutes)
Blood Pressure (mmHg)		
Heart Rate (bpm)		
Symptoms ¹ Dizziness or light-headedness Fainting Blurred or fading vision Nausea Fatigue Lack of concentration	No Yes	No Yes
Results	Normal	Abnormal

Orthostatic hypotension: a drop in systolic BP \ge 20 mmHg between supine and standing positions. Orthostatic tachycardia: an elevation in HR of \ge 30 bpm when transitioning between the supine and standing positions, in the absence of orthostatic hypotension.

Cervical Spine Assessment

Cervical Spine Palpation	Signs a	nd Symptoms	Location
/luscle Spasm	Normal	Abnormal	
/idline Tenderness	Normal	Abnormal

Additional Clinical Notes

Return-to-Learn (RTL) Strategy

Facilitating RTL is a vital part of the recovery process for student-athletes. HCPs should work with stakeholders on education and school policies to facilitate academic support, including accommodations/learning adjustments for students with SRC when needed. Academic support should address risk factors for greater RTL duration (e.g., social determinants of health, higher symptom burden) by adjusting environmental, physical, curricular, and testing factors as needed. **Not all athletes will need a RTL strategy or academic support**. If symptom exacerbation occurs during cognitive activity or screen time, or difficulties with reading, concentration, or memory or other aspects of learning are reported, clinicians should consider implementation of a RTL strategy at the time of diagnosis and during the recovery process. When the RTL strategy is implemented, it can begin following an initial period of relative rest (Stage 1: 24-48 hrs), with an incremental increase in cognitive load (Stages 2 to 4). Progression through the strategy is symptom limited (i.e., no more than a mild exacerbation of current symptoms related to the current concussion) and its course may vary across individuals based on tolerance and symptom resolution. Further, while the RTL and RTS strategies can occur in parallel, student-athletes should complete full RTL before unrestricted RTS.

Step	Mental Activity	Activity at Each Step	Goal
1	Daily activities that do not result in more than a mild exacerbation* of symptoms related to the current concussion.	Typical activities during the day (e.g., reading) while minimizing screen time. Start with 5–15 min at a time and increase gradually.	Gradual return to typical activities.
2	School activities.	Homework, reading, or other cognitive activities outside of the classroom.	Increase tolerance to cognitive work.
3	Return to school part time.	Gradual introduction of schoolwork. May need to start with a partial school day or with greater access to rest breaks during the day.	Increase academic activities.
4	Return to school full time.	Gradually progress school activities until a full day can be tolerated without more than mild* symptom exacerbation.	Return to full academic activities and catch up on missed work.

NOTE: Following an initial period of relative rest (24-48 hours following injury at Step 1), athletes can begin a gradual and incremental increase in their cognitive load. Progression through the strategy for students should be slowed when there is more than a mild and brief symptom exacerbation.

*Mild and brief exacerbation of symptoms is defined as an increase of no more than 2 points on a 0-10 point scale (with 0 representing no symptoms and 10 the worst symptoms imaginable) for less than an hour when compared with the baseline value reported prior to cognitive activity.

Return-to-Sport (RTS) Strategy

Return to sport participation after an SRC follows a graduated stepwise strategy, an example of which is outlined in Table 2. RTS occurs in conjunction with return to learn (see RTL strategy) and under the supervision of a gualified HCP. Following an initial period of relative rest (step 1: approximately 24-48 hours), clinicians can implement step 2 [i.e., light (step 2A) and then moderate (step 2B) aerobic activity] of the RTS strategy as a treatment of acute concussion. The athlete may then advance to steps 3-6 on a time course dictated by symptoms, cognitive function, clinical findings, and clinical judgement. Differentiating early activity (step 1), aerobic exercise (step 2), and individual sport-specific exercise (step 3) as part of the treatment of SRC from the remainder of the RTS progression (steps 4-6) can be useful for the athlete and their support network (e.g., parents, coaches, administrators, agents). Athletes may be moved into the later stages that involve risk of head impact (steps 4-6 and step 3 if there is any risk of head impact with sport-specific activity) of the RTS strategy following authorization by the HCP and after resolution of any new symptoms, abnormalities in cognitive function, and clinical findings related to the current concussion. Each step typically takes at least 24 hours. Clinicians and athletes can expect a minimum of 1 week to complete the full rehabilitation strategy, but typical unrestricted RTS can take up to one month post-SRC. The time frame for RTS may vary based on individual characteristics, necessitating an individualized approach to clinical management. Athletes having difficulty progressing through the RTS strategy or with symptoms and signs that are not progressively recovering beyond the first 2-4 weeks may benefit from rehabilitation and/or involvement of a multidisciplinary team of HCP experienced in managing SRC. Medical determination of readiness to return to at-risk activities should occur prior to returning to any activities at risk of contact, collision or fall (e.g. multiplaver training drills), which may be required prior to any of steps 3-6, depending on the nature of the sport or activity that the athlete is returning to and in keeping with local laws/requirements.

Step	Exercise Strategy	Activity at Each Step	Goal
1	Symptom-limited activity.	Daily activities that do not exacerbate symptoms (e.g., walking).	Gradual reintroduction of work/school.
2	Aerobic exercise 2A – Light (up to approx. 55% max HR) then 2B – Moderate (up to approximately 70% max HR)	Stationary cycling or walking at slow to medium pace. May start light resistance training that does not result in more than mild and brief exacerbation* of concussion symptoms.	Increase heart rate.
3	Individual sport-specific exercise NOTE: if sport-specific exercise involves any risk of head impact, medical determination of readiness should occur prior to step 3.	Sport-specific training away from the team environment (e.g., running, change of direction and/or individual training drills away from the team environment). No activities at risk of head impact.	Add movement, change of direction.
Steps 4-6 should begin after resolution of any symptoms, abnormalities in cognitive function, and any other clinical findings related to the current concussion, including with and after physical exertion.			
4	Non-contact training drills.	Exercise to high intensity including more challenging training drills (e.g., passing drills, multiplayer training). Can integrate into team environment	Resume usual intensity of exercise, coordination, and increased thinking.

		into team environment.	increased thinking.
5	Full contact practice.		Restore confidence and assess functional skills by coaching staff.
6	Return to sport.	Normal game play.	

maxHR = predicted maximal Heart Rate according to age (i.e., 220-age)

Age Predicted Maximal HR= 220-age	Mild Aerobic Exercise	Moderate Aerobic Exercise
55%	220-age x 0.55 = training target HR	
70%		220-age x 0.70 = training target HR

NOTE: *Mild and brief exacerbation of symptoms (i.e., an increase of no more than 2 points on a 0-10 point scale for less than an hour when compared with the baseline value reported prior to physical activity). Athletes may begin Step 1 (i.e., symptom-limited activity) within 24 hours of injury, with progression through each subsequent step typically taking a minimum of 24 hours. If more than mild exacerbation of symptoms (i.e., more than 2 points on a 0-10 scale) occurs during Steps 1 -3, the athlete should stop and attempt to exercise the next day. If an athlete experiences concussion-related symptoms during Steps 4-6, they should return to Step 3 to establish full resolution of symptoms with exertion before engaging in at-risk activities. Written determination of readiness to RTS should be provided by an HCP before unrestricted RTS as directed by local laws and/or sporting regulations.
